Spec-driven development (SDD)

(Structured?)

Specifications ⟹ Executable source of truth

SDD ≠ Github Copilot ... Generating directly from the beginning

① Procedure

1. Spec kit ... Project documentation ⟹ Specification file(s)
   Technical plan(s)
   Implementation task(s)

2. Copilot ... uses ⟹ Generating aligned, production-ready code

⇒ (four distinct phrases) Specify, plan, tasks, and implement

② Reasons

"Vibe coding" ... a chunk of code can be generated fast ≠ but might be misaligned

→ Lacking information of previous decisions / general project requirements

Why "SDD" offers a better approach

1. Concentrating primarily on: "Code serve specifications"
2. Solving directly "the ongoing issue" - making specification executable ???

Need to check before moving forward! ← (accumulated?)

⇒ Concept: Agile principles

◦ Differences:

1. Not mean writing a massive spec and never changing it → starting a clear spec and can be evolved.
2. Treating each user story with a micro-cycle

Summary
